(54) MONITOR DEVICE FOR COMBUSTION EQUIPMENT

(57)Abstract:

PROBLEM TO BE SOLVED: To objectively display the life expectancy of a combustion equipment.

SOLUTION: The relation between data (t) corresponding to the use state of the combustion equipment and data λ corresponding to its fault rate is previously given as life expectancy curve data. While the use state is monitored and a signal connection with the combustion equipment stored with data on the monitored use state is made, the data corresponding to the use state are inputted from the combustion equipment. The life expectancy curve data are displayed on the screen of the display that the monitor device is equipped with, and the position of the inputted data corresponding to the use state is displayed. When the use time of the combustion equipment is long and secular changes of constituent members constituting the combustion equipment become worse to reach the life of the combustion equipment, the position of the data corresponding to the use state is displayed on the screen within the wear fault period T_{if} of the life expectancy curve data and the end of the life of the combustion equipment can objectively be displayed.
